

MO8 RPU MDT System

Assistant Commissioner briefing pack

Prepared as an overview of the live Personnel Hub, Operations/CAD workspace, recruitment portal, supervisory workflow, legal guidance, evidence handling, CID package generation and Discord-linked notification model.

Generated 23/07/2026. Demonstration screenshots use roleplay data only.

The system is deliberately modular. Individual pages, permissions, workflows, reports, document templates and Discord alerts can be added, removed, renamed or restricted without changing the core design. This means MO8 can pilot the system with a small command group, simplify it for wider release, or expand it into a broader operational platform as policy and roleplay requirements develop.

The Windows-style entry point lets users choose the Personnel Hub or the Operations/CAD workspace after sign-in.

Executive summary

System purpose and operating model

The MDT combines two connected systems. The Personnel Hub is the internal database for officers, training, supervision, documents, applications, requests, tasks and management records. The Operations/CAD workspace is the live operational side for duty status, callsigns, CADs, incidents, offences, police powers, evidence, briefings, casework and supervisor review.

Both areas use the same account, rank, tag and permission model. That means an officer's role in the Personnel Hub also controls what they can see or do in Operations: for example, a Sergeant can receive supervisory tasks, a Controller can manage units, and command ranks can review broader performance and audit information.

The design goal is not just storing information. It is to guide officers through repeatable workflows, keep a transparent record of decisions, notify the right people when something changes, and make later review much easier.

Personnel Hub dashboard with live tasks, activity, notice board and calendar context.

Security and permissions

Login, app selection and access control

Users sign in once and are then presented with the app-style selection screen. From there, they can open the Personnel Hub or Operations/CAD, depending on their permissions. This adds to the roleplay feel while still keeping the system simple for less technical users.

Permissions can be controlled by rank, by tag/sub-role, and by specific officer override. This is important because MO8 has several overlapping structures: rank, roads policing teams, training responsibilities, supervisor assignments, Controller access and command responsibilities.

Command can also use the 'View MDT as...' simulator to see what the system would look like for a different combination of rank, tags and training. That makes permission testing safer before access is granted widely.

Permission editor and command visibility tooling.

Settings and command simulator area.

Fast navigation

Global search and personal inbox

The global search is intended to become the main way of jumping around the MDT. Officers can search across officers, records, documents, CADs, cases, legal references and other indexed information. Search results open first as a summary popup, allowing the user to confirm they have the correct item before navigating to the full record.

The personal inbox brings together notifications, assigned tasks, document acknowledgements, calendar items, supervisor contact and system updates. This reduces the need for officers to check several pages just to understand what needs their attention.

Discord DMs can mirror important MDT notifications. For example, account creation, password reset, LOA decisions, calendar assignment changes, course approvals, supervisory updates and other configured events can be sent directly to the officer where a Discord ID is held.

Global search across the wider MDT.

Personal inbox for notifications, actions and assigned work.

Work allocation

Task system and supervisor workflow

The task system separates 'My Tasks' from wider review queues. Every officer can see tasks specifically assigned to them, while supervisors and command ranks can also access the queues they have permission to review. This prevents lower ranks from seeing sensitive management work while still allowing them to action their own returned items or supervisor-assigned work.

Tasks are linked back to their source wherever possible. A leave request opens the LOA review, an AIP signature opens the AIP document, a CAD returned for amendment opens the relevant CAD review, and an activity issue opens the officer record with the action required. Where a task is advisory rather than procedural, it can be cleared with an audit record.

Supervisor-specific tasks are highlighted when the subject officer is assigned to that supervisor. Other authorised officers can still help with the wider queue, but the system makes responsibility visible.

The screenshot displays the 'MO8 Personnel Hub' interface, specifically the 'Tasks' page. The sidebar on the left contains navigation links: 'MO8 Personnel Hub', 'SR Search all records', 'HOME' (with links to DB Dashboard, IN Inbox, CH Chat, ME My Profile, and TK Tasks, which is highlighted), 'CA Calendar', 'TL Timeline', 'PERSONNEL' (with links to SH Shift Log, SV Supervisor, and OF Officers). The main content area is titled 'Tasks' and includes a sub-header 'Outstanding approvals and command actions'. It features a 'Tasks' section with an 'Assign task' button and a 'My Tasks' section with filters for 'My Open Tasks' (0), 'Due Soon' (0), 'Amendments' (0), and 'Available Queue' (1). Below these are search and filter options for type, priority, status, due date, and sort order. The bottom status bar shows the user is 'admin' at '17:58'.

Task page showing personal tasks, review queues and workflow filters.

Personnel records

Officer profile, activity and management record

Each officer has a linked profile and account. Adding an officer through the MDT creates the related user record, avoiding the old problem where officers and users had to be maintained separately. Profiles can hold rank, callsign, tags, training, supervisor, status, LOA, discipline, restrictions, probation, development plans, reviews and activity history.

The officer profile is designed as the central record. Supervisors can see the officer's recent shift activity, CAD involvement, outstanding tasks, current LOA status, training gaps, development plans and management notes from one place. Officers can also view appropriate parts of their own record, including their own disciplinary or AIP records where permitted.

Management records such as performance reviews, probation records, restrictions and AIPs can be archived or deleted according to permission, while retaining audit evidence of who performed the action and when.

Officer roster and profile access.

Officer-facing profile view.

Performance management

AIP, development and supervisory checks

The MDT supports Activity Improvement Notices, development plans, check-ins, probation records, performance reviews and restrictions. AIP documents can be created from the MDT, routed to a line manager and senior authorising officer for signature, downloaded for issue, and then reviewed at the end of the improvement period.

If the review date arrives, a task is generated for the line manager. The AIP can also be reviewed early if command need to close it sooner. The system flags whether the officer has been on LOA recently so activity concerns can be considered in context rather than judged in isolation.

The purpose is to make performance management consistent, transparent and reviewable, while still leaving final decisions with supervisors and command.

Development, AIP and officer management records.

Supervisor dashboard for assigned officers and workload.

Learning and standards

Training matrix and course booking

Training is stored as structured data rather than plain notes. Tick-box qualifications such as Taser, Method of Entry, Blue Ticket and Motorbike sit alongside level-based driving standards such as Basic, Response, IPP, Advanced and Advanced + TPAC.

The training page includes a spreadsheet-style matrix so supervisors and trainers can update many officers efficiently. Training options can be managed by senior ranks, allowing the available qualifications to evolve with the unit.

Courses are handled separately from qualifications. Trainers or authorised ranks can create sessions, officers can request a seat, course staff can approve, deny, waitlist or mark attendance, and successful completion can update the training record automatically.

Spreadsheet-style training matrix.

Course management, seat requests and trainer workflow.

Knowledge and intake

Documents, notices and recruitment

The documents area acts like a file explorer, with folders, subfolders, uploaded files, restrictions by rank and tags, and document acknowledgements. This allows training guides, SOPs and policy documents to be made visible only to the people who need them.

The notice board gives command a fast way to publish unit-wide updates. Recruitment adds a public-facing careers side of the same system: job adverts can be posted, application fields can be configured, internal and external applicants can apply, and reviewers can be assigned by specific officer.

Application updates can trigger Discord messages, and applicant accounts allow candidates to track their own progress without exposing the internal MDT.

Folder-based document explorer.

Recruitment and job application management.

Operational planning

Calendar, shifts and activity records

The calendar combines personal assignments, courses, meetings and approved LOA. Month, week and day views make it easier to see when activity is expected, when officers are unavailable, and when training or reviews are due.

Shift logging is tied into duty status. Officers can start and end shifts with a clear state indicator, receive prompts if they try to perform shift-related CAD activity while not on duty, and submit retrospective shift requests if they forgot to start a shift. Supervisors can review, edit or delete shifts with audit records and officer notification.

Activity is summarised in hours and minutes, with views for the officer's own activity and supervisor/command views for team activity, inactivity, quota concerns and active LOA.

Calendar view for LOA, courses, meetings and assignments.

Shift logging and activity review.

Live command environment

Operations/CAD workspace

The Operations workspace is intentionally separate from the Personnel Hub. It has its own operational navigation, live CAD queue, unit table, callsign management, communications, control room board, legal reference and archive. Officers choose it from the landing screen when they are carrying out operational work.

A CAD can hold title, priority, location, incident type, attending units, linked people, linked vehicles, evidence, notes, outcomes, offences, police powers, supervisor review status and eventual archive information. This gives command a clear record of what happened, what decisions were made and what evidence was relied on.

Controllers can manage unit status and assignment, while officers can assign themselves more quickly without opening the full edit form. This supports both self-led patrol work and more structured dispatch.

Live CAD workspace.

Control room board for live operational overview.

CAD workflow

Creating and opening a CAD

When a new CAD is created, the officer records the incident type, priority, location, summary and any initial linked information. This gives the operational side a consistent starting record. As the incident develops, notes, actions, linked entities and outcomes can be added rather than relying on informal memory or Discord messages.

The opened CAD becomes the incident workspace. The user can add logs, evidence, person or vehicle intelligence, officer activity, enforcement outcomes, police power records and supervisor review notes from the same record.

The screenshot on the right shows a real archived traffic stop CAD with linked vehicle and person data, recorded outcomes and a timeline of actions.

Example CAD creation form with incident details filled in.

Opened archived traffic stop CAD.

Linked people and vehicles

CAD intelligence and repeat-offender warnings

People and vehicles are not treated as one-off text entries. When a person, vehicle or registration plate is linked to a CAD, the system can surface previous CAD links, warnings, recent arrests, FPNs and other outcomes. This helps officers spot repeat patterns and avoid treating a second incident as if it is the first.

For example, if a vehicle has already been stopped that day and the driver received a warning for speeding, a later CAD involving the same driver or vehicle can flag that previous outcome and link back to the CAD. That gives officers better context when choosing a new disposal.

This also supports later intelligence work. Command can search a person or vehicle and see connected CADs, outcomes, linked subjects, warning markers, evidence and casework links.

CAD intelligence section showing linked persons, vehicles and recorded outcomes.

Operational intelligence search and relationship view.

Offence-led guidance

Recording enforcement outcomes

When an officer records an enforcement result, they select the person or vehicle, choose the action taken, and search the offence catalogue. The search is designed to show the offence title first, so officers can find items such as Dangerous Driving without being forced to read a long code first.

Multiple offences can be selected where appropriate. The system can then suggest the usual disposal, fine amount, arrest time and any repeat-offending guidance. Officers can override values where policy allows, but the recommended information remains visible to support consistency.

The form also prompts for grounds, rationale, outcome report and notes. These fields are encouraged rather than blocking submission, because operational entries sometimes need to be made quickly, but the interface reminds officers that stronger rationale is expected for serious actions.

Actual enforcement outcome form before offence selection.

Dangerous Driving selected with offence guidance, FPN, arrest time and repeat tariff guidance.

PACE and power recording

Police powers and use of force logs

The CAD does not only record offences. It also records the use of police powers, searches, detentions, seizures and other actions taken against a person or vehicle. This is especially important where the officer is relying on a specific power rather than simply issuing an outcome.

The workflow asks the officer to select the person or vehicle, identify the power used, record objective grounds, explain necessity and proportionality, note the outcome, record any items seized and include duration where relevant. This allows supervisors to review whether the action was justified and properly recorded.

The same approach can be expanded as legislation changes. More powers can be added to the reference set, with guidance text shown in the same way as offence guidance.

Actual use of police power form from the CAD workflow.

Searchable legal reference library for offences and police powers.

Officer decision support

Legal reference search

The legal reference page gives officers a searchable source of offence and power guidance inside the MDT. This is designed for quick operational use: officers can search for a phrase, offence, section, disposal type or power and receive the relevant summary.

For offences, the reference can include the title, offence code, legislation source, description, usual disposal, FPN value, arrest timing, escalation guidance and repeat-offending notes. For police powers, it can explain when the power should be used and what needs to be recorded.

This makes the CAD more than a logging tool. It actively supports better decision-making and helps officers use the correct powers and outcomes during roleplay incidents.

The screenshot displays the 'INTERNAL TERMINAL' Operations Hub interface. At the top, it shows the user 'admin Commissioner' with buttons for 'Notifications', 'Password', 'Switch hub', and 'Logout'. Below this, a status bar indicates 'MET OPERATIONS 8 CONTROL / CAD' with various unit and status counts (0 units, 0 available, 0 active CAD, 0 urgent, 1 online, Off Duty status). A navigation bar includes links like 'LIVE CAD', 'UNITS', 'CONTROL ROOM', 'COMMS', 'WORK QUEUE', 'CASEWORK', 'DEPLOYMENTS', 'INTEL', 'LEGAL REFERENCE' (highlighted), 'ARCHIVE', 'PERFORMANCE', and 'SUPERVISOR SIGN-OFF'. The main section is titled 'Offences and police powers' and features a search bar with the text 'Search offence or power by title, section, code or keyword'. Below the search bar, a grid displays eight items, each with an offence code, title, legislation source, description, and disposal type. The items are: 'Accessory to an offence' (Offences Against the Person Act 2025 / Section 9), 'Affray' (Public Order Offences Act 2024 / Section 3), 'Aggravated trespass' (Proprietary Offences Act 2025 / Section 2), 'Animal cruelty' (Proprietary Offences Act 2025 / Section 8a), 'Arrest without warrant' (POWER / PACE-55), 'Arson' (OFFENCE / MO8-PR-009), 'Assault occasioning actual bodily harm' (OFFENCE / MO8-AP-002), and 'Assault on an emergency worker' (OFFENCE / MO8-AP-008). The bottom of the interface shows a navigation bar with icons for 'MO8', 'PD Personnel', 'ME My Profile', 'TK Tasks', 'SR Search', 'CH Chat', 'DO Documents', 'CA Calendar', 'TR Training', 'CAD CAD', and a user status 'admin 18:00'.

OFFENCE / MO8-AP-009	OFFENCE / MO8-PO-003	OFFENCE / MO8-PR-002	OFFENCE / MO8-PR-011
Accessory to an offence	Affray	Aggravated trespass	Animal cruelty
Offences Against the Person Act 2025 / Section 9	Public Order Offences Act 2024 / Section 3	Proprietary Offences Act 2025 / Section 2	Proprietary Offences Act 2025 / Section 8a
Assisting, encouraging or enabling another person to commit an offence.	Using or threatening unlawful violence towards another so that a reasonable person would fear for their safety.	Trespassing with intent to intimidate, obstruct or disrupt people carrying out a lawful activity.	Intentionally causing unnecessary harm or death to an animal.
Arrested / 3 minute arrest	Arrested / 3 minute arrest	Arrested	Arrested / 4 minute arrest

POWER / PACE-55	OFFENCE / MO8-PR-009	OFFENCE / MO8-AP-002	OFFENCE / MO8-AP-008
Arrest without warrant	Arson	Assault occasioning actual bodily harm	Assault on an emergency worker

Legal reference search showing offence and power information.

CID package generation

Exporting a professional case pack

A CAD, case or incident can be exported as a presentable CID referral package. The intent is that the officer can gather the relevant record once, export it cleanly, then send it directly to CID for consideration without manually copying every note into a separate document.

The package includes identifiers, CAD numbers, officer information, linked persons and vehicles, offences, offence codes, recorded powers, outcomes, evidence links, notes, intelligence warnings and supervisor review information where relevant. If images are attached, they can be embedded or previewed; videos can be referenced through secure links.

The export workflow also supports a drawn digital signature. The signature is added to the final PDF so the package has a clear submitting officer record.

Field	Example included in exported CID package
CAD number	MO8-20260628-203716
Incident type	Traffic stop
Location	Bus Stn
Linked vehicle	Black Vauxhall Vivaro - registration 1234
Linked person	person1
Offence	Dangerous driving - MO8-RD-002 - Road Traffic Section 4(2)
Suggested disposal	FPN GBP 3000, arrest time 4 minutes, repeat tariff up to GBP 4500 where justified
Officer rationale	Vehicle observed driving far below the expected standard and creating danger to other road users.
Evidence	Screenshot links, CAD notes, officer action logs and supervisor review history

Example shown for demonstration. Live exports use the selected CAD/case data and attached evidence from the MDT.

Quality assurance

Supervisor CAD review and post-incident learning

Closed CADs can be routed for supervisor review. The reviewer should see the full incident context: CAD summary, notes, linked people and vehicles, outcomes, police powers, evidence and the officer actions taken. They can sign it off, return it for amendment, or require attention.

If returned, the officer receives a task explaining what needs to be amended. Once they update the CAD, it can be sent back for review. This creates a controlled improvement loop rather than a vague message outside the system.

Post-incident learning can be recorded against the CAD, allowing command to identify recurring training needs, common recording gaps and examples of good practice.

Supervisor sign-off and review queue.

Operational work queue for reviews and outstanding action.

Dispatch and deployment

Units, callsigns and control room workflow

Officers on shift can create or join callsigns/units. A solo officer can book onto their own callsign, while double-crewed or larger units can allow other active users to request to join. Units show member names, status, assigned CADs, vehicle, notes and operational capability.

Capability is calculated from members. If one member holds Taser, the unit can be shown as Taser-capable. If the highest driving standard in the unit is Advanced, the unit can be displayed as Advanced rather than only showing every individual qualification.

Controllers can use a board-style view to assign units to jobs, update statuses, view callsign availability, search details for officers, and manage the roster. This is the operational equivalent of a live control room table.

Unit/callsign management.

Live control room board.

Audit and transparency

Evidence integrity and archive

Evidence can be linked directly to CADs and cases. The system records metadata such as uploader, time, relationship to the incident and notes. Evidence integrity features can help show whether evidence was added, changed, removed or replaced after the fact.

Archived CADs remain searchable. This is important because old incidents can become intelligence for later traffic stops, repeat offenders, supervisor reviews, activity reporting or CID case building.

Deletion and archive actions are separated from ordinary editing and should create audit records. This protects both officers and supervisors by making sensitive record changes transparent.

Audit trail for sensitive system actions.

Strategic use

Reporting, data centre and command oversight

The system can turn daily roleplay activity into useful management information. Reports can show active officers, shift totals, training coverage, inactivity, outstanding tasks, CAD outcomes, repeated offence patterns and document acknowledgement gaps.

The data centre and timeline views allow command to inspect what has happened across the whole MDT or within a specific officer, CAD, person, vehicle, case or document. This is useful for audits, dispute resolution and spotting patterns over time.

Because the system is structured around records rather than chat messages, it can support long-term transparency and more consistent command decision-making.

Reports and management information.

Data quality and system health checks.

Implementation approach

Suggested rollout

A sensible rollout would be staged. The first phase could focus on Personnel Hub, officer records, documents, training, tasks and LOA. The second phase could add CAD and shift-linked operational use for supervisors and selected officers. The third phase could add public recruitment, wider officer access, Controller workflows and CID package exports.

Features can be hidden until the command team is ready for them. The permission model means Constables can have a clean officer-facing experience while Sergeants, Inspectors and command ranks see the management and operational tools they need.

The system should be treated as configurable infrastructure for MO8 rather than a fixed product. If a workflow changes, the MDT can be adapted around the new process instead of forcing the unit to keep using a workflow that no longer fits.

App selection screen for staged access to the system.
